Executive Summary

The headline finding and recommendation at a glance

RECOMMENDATION

Do not ship the new checkout page. The treatment showed no statistically significant improvement over control (p = 0.19).

Control conversion rate

12.04%

145,274 users · 17,489 conv.

Treatment conversion rate

11.88%

145,311 users · 17,264 conv.

Treatment vs control

–0.16pp

p = 0.19 · not significant

Statistical test: two-proportion z-test

z-stat: **-1.31** p-value: **0.1897** 95% CI: **[-0.39pp, +0.08pp]**

Sanity checks passed: 50/50 split confirmed across all 3 markets · 290,585 unique users after deduplication · duplicates sensitivity-checked, conclusion unchanged

What We Tested & Why

Experiment design and hypothesis

HYPOTHESIS

A redesigned checkout page will reduce user friction and increase the proportion of visitors who complete registration.

PRIMARY METRIC

Landing page conversion rate
(% of users who registered)

GUARDRAIL METRICS

Country-level conversion · Group balance · Data quality · Session duration

TEST SETUP

Traffic split	50% control / 50% treatment
Control	Old landing page (old_page)
Treatment	New landing page (new_page)
Markets	US (70%), UK (25%), CA (5%)
Unique users	290,585 (after deduplication)
Conversion def.	User completes registration

Sanity Checks — Was the Test Set Up Correctly?

Validating data quality and randomization before analysis

✓ **All sanity checks passed — randomization confirmed, data quality verified**

✓ **PASS**

Overall group split

49.99% / 50.01%

Control 145,274 · Treatment 145,311

✓ **PASS**

US split

49.95% / 50.05%

101,716 control · 101,906 treatment

✓ **PASS**

UK split

50.18% / 49.82%

36,360 control · 36,106 treatment

✓ **PASS**

CA split

49.64% / 50.36%

7,198 control · 7,299 treatment

Data quality: 2 duplicate user IDs found (759899, 773192) and 1 duplicate in countries table. Sensitivity check confirmed conclusion is unchanged after deduplication.

Conversion Rate Results

Top-line and country-level breakdown

Control rate

12.04%

17,489 conversions

Treatment rate

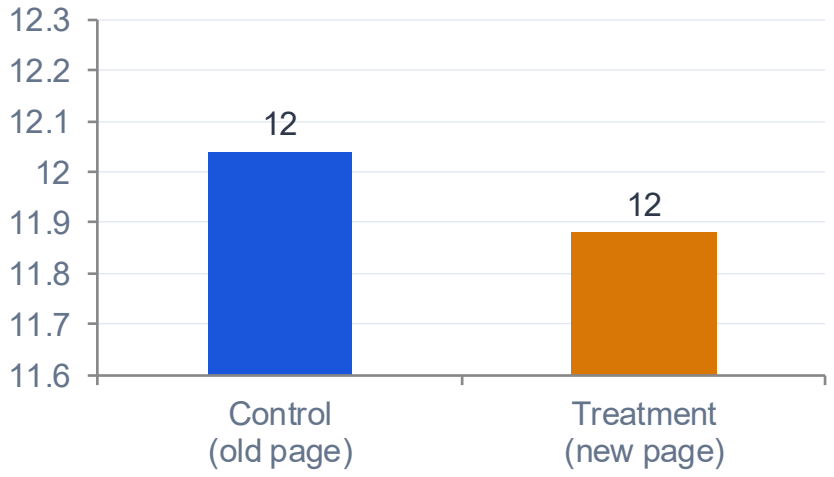
11.88%

17,264 conversions

Absolute delta

−0.16pp

Favors control



BY COUNTRY

Market	Control	Treatment	Δ
US US (70%)	12.06%	11.85%	−0.22pp
GB UK (25%)	12.00%	12.12%	+0.11pp
CA CA (5%)	11.88%	11.19%	−0.69pp

UK is the only market with a marginal positive signal (+0.11pp). US and CA both favored control. No country result overturns the overall null finding.

Statistical Significance & Regression

Formal hypothesis testing confirms the null result

Z-TEST RESULTS

Two-proportion z-test

z-statistic	**−1.3116**
p-value	**0.1897**
Significance	**Not significant (> 0.05)**
95% CI lower	**−0.3939 pp**
95% CI upper	**+0.0781 pp**

The CI includes zero — the true effect could be slightly positive or negative.

LOGISTIC REGRESSION

Model	Coef.	p-val	Note
Group only	**−0.0150**	**0.1897**	Baseline
+ Country controls	**−0.0150**	**0.1901**	Unchanged
+ Country interactions	**−0.0674**	**n.s.**	No sig. interactions

KEY TAKEAWAY

Adding country controls or interaction terms does not change the treatment effect. The null result is robust across all three model specifications.

Risks, Caveats & Data Quality

What we know, what we flagged, and what to watch

Null result is robust

Three model specs (z-test, logistic regression, logistic + country controls) all produce $p \approx 0.19$. The result is consistent and not sensitive to analytical approach.

UK shows marginal positive signal

Treatment conversion was +0.11pp higher in the UK. This is not statistically significant but may be worth exploring in a follow-up test targeted at UK users.

CA sample is small — treat as directional

Canada's 14,497 users produced the largest negative gap (−0.69pp) but also the least statistical power. CA findings should not drive the overall recommendation.

Duplicate users & no novelty effect check

Two duplicate user IDs were identified. Sensitivity check confirmed conclusion is unchanged. No date field was available to check for novelty effect bias over time.

RECOMMENDATION

Do Not Ship

the new landing page

Control converted at 12.04% vs treatment at 11.88% (−0.16pp). p-value of 0.19 confirms no statistically significant lift. Consistent across all three model specs and two of three markets.

NEXT STEPS

1. Keep the old landing page as the default — no change in production
2. Investigate the UK's marginal +0.11pp signal with a targeted follow-up test
3. Conduct qualitative research — why didn't the redesign convert better?
4. Revise the treatment design, monitor for duplicate user IDs, and retest
